Streaming Platform Delivery Specification

> *Synthetic demo document, not a real company document.*

1. Scope

1.1 This specification defines the technical requirements for delivering finished episodes to streaming platforms.

1.2 Linear TV deliveries follow the Broadcast Delivery Specification (TECH-DELIVERY-BROADCAST).

1.3 Where a platform issues its own written specification for a title, that specification prevails for that title.

2. Video

2.1 Package: IMF App 2E (IMF Application 2E).

2.2 Resolution: 3840x2160 (UHD).

2.3 Frame rate: 25 fps.

2.4 HDR10 is optional; when an HDR10 version is delivered, an SDR version is delivered alongside it in the same IMF package.

3. Audio

3.1 Two mixes are delivered: 5.1 and stereo.

3.2 Loudness: -24 LKFS, dialogue-gated.

3.3 True peak: maximum -2 dBTP.

3.4 Loudness reports for both mixes are attached to each delivery.

4. Subtitles

4.1 Subtitles are delivered as timed text in IMSC1 format.

4.2 Languages: Arabic and English.

4.3 Subtitle files are included in the IMF package as separate tracks.

5. Delivery Schedule

5.1 Episodes are delivered 30 days before the release date.

5.2 Delivery method and upload credentials are agreed with each platform per title.

6. Quality Control

6.1 Post-production runs a full QC pass on every package before upload, and keeps the QC report on file.

6.2 Any platform rejection is logged and redelivered with an incremented version.
